THE CONCEPT

Your own AI investment analyst

Not an AI stock picker. A bot that tests your thesis against new evidence.

THESIS → DATA → CHALLENGE → DECISION

Always-on monitoring • Source-backed signals • Alerts only when something matters

STEP 01

Write the thesis before building the bot

Define what must go right — and what would prove you wrong.

Example: PLUG

Bull: gross margins improve; cash burn falls; dilution slows.

Kill criteria

New equity issuance, shrinking liquidity or a missed path to profitability.

STEP 02

Give the bot three intelligence layers

01 FUNDAMENTALS

SEC filings, cash flow, gross margin, liquidity, dilution and guidance.

02 SMART MONEY

13F changes, insiders, short interest and price/volume versus history.

03 SENTIMENT

Analyst revisions, sector performance, news and credible investor discussion.

STEP 03

Copy this prompt into ChatGPT

Then ask it to create a recurring monitoring task.

READY-TO-USE PROMPT

“Monitor [TICKER] daily. Test my thesis: [THESIS]. Track fundamentals, institutional positioning and sentiment. Compare QoQ/YoY. Separate facts from hypotheses. Alert me only on material changes. Update bull/base/bear scenarios, dilution risk and the evidence that could falsify my thesis. Cite primary sources.”

STEP 04

Make decisions — not notifications

The bot is a research assistant, not an autonomous portfolio manager.

GOOD ALERT

“Cash burn fell 40%, gross margin improved, and share count remained stable — supported by the latest 10-Q.”

BAD ALERT

“The stock is trending on social media. Buy now!”

AI improves the process. You still own the judgment.
